Front-End Development at Blink

Blink offers front-end development services to transform beautiful design mockups into fast, secure, and accessible web experiences. Whenever possible, our UX Engineers (aka our front-end developers) work hand-in-hand with our designers to solve problems and make decisions. We believe this close collaboration results in a better product and creates a significant savings of time and effort.

Blink's front-end developers live and breathe front-end development. They stay current on the latest specs and features the browser offers. Every person on our team appreciates design and pays close attention to detail.

We use an agile-inspired process that includes creating a backlog, sprint planning, demos, and standup as frequently as needed. This keeps our process lean so we can focus on producing results rather than reporting status.

When it's tough to deploy, our team works directly with your team to integrate our code base into yours. We have experience working with developers on various technology stacks and software platforms.

We have helped our clients integrate our code into platforms running on Apache, NGINX, IIS, .NET, J2EE (Tomcat/JBoss), Ruby, Node / Express, and Django. We have delivered HTML5, CSS, and JavaScript utilizing Angular.js, React.js, Backbone.js, Require.js, three.js, d3.js, vue.js, jQuery, Bootstrap, SASS, LESS, and many other popular libraries. If your project requires a CMS, we recommend Contentful, Craft, WordPress, or Sitecore. [Contact our team](#) to learn more about Blink's development capabilities.
